

House sewage systems

Argonomy of house sewage systems:
because tidiness and care start at home

ARGO d.o.o. is a Slovenian company established in 1990. We deal with manufacturing and trade activities. Initially it was engaged in designing and production of specialised nautical equipment, deck equipment of vessels for recreational and competitive sailing. Today the sailing boat production represents 5% of the whole production.

In 1991 we added a programme of house sewage systems to the nautical programme. The programme of the production of pipes and polypropylene fittings has successfully expanded and soon surpassed the nautical programme. Today it represents as much as 70% of the production. Argo is a manufacturer of sanitary plastic products with the most wide-ranging programme in the country. The quality of our products is second to none in Slovenia and we are also successfully proving our worth in the markets of Western and Eastern Europe.

In 2001 we launched the third programme: the programme of polyethylene cable ducts which currently represents 25% of our production.

We are operating on an area of 17,000 m², 4,000 m² of those are covered.

Yearly we produce approximately 1,000 tons of polyethylene and 3,000 tons of polypropylene. We also offer our clients a comprehensive programme of pipe systems including pipes and fittings for house sewage systems, street sewage systems, drainage, plumbing etc.

Despite the fact that we are already successful in our activities we do not intend to rest. We are expanding, complementing and improving our offer. So it is no coincidence that we named our company Argo. In mythology Argo was the name of Jason's ship that carried the fearless and daring sailors into the unknown world to find the Golden Fleece. Daring, boldness and the desire to make new discoveries is the entrepreneurial spirit of the Argonauts that also pervades our company. This is why we constantly expand and upgrade our manufacturing capacities, invest in professional training, follow the world trends and develop innovative solutions.

All this enables us to reach our most important goal: the satisfaction of our customers. We strive to offer our every client not just products of high quality but also solutions that are tailored for the client's specific needs and wishes. Following this mission is also the best guarantee for an even greater success on the broader European market, including Slovenia.

Polypropylene – a modern story of success

Polypropylene is a polymer with no odour and colour, which is slightly transparent to opaque and can be coloured in an easy way and in multiple hues. Its most important properties are high bruising resistance and resistance to most chemical substances, it is highly resistant to physical damage, detergents and tensioactive materials even at high temperatures, to dissolved inorganic substances in water, low-concentration inorganic acids, basic solutions, alcohols and some oils. But it is not resistant to strong oxidising agents, chlorine sulphuric acid, 100% oleum, to evaporating nitrate acid and to halogen hydrocarbons. It is also not suitable for adhesives.

It is resistant to almost every acid, base or salt even in high concentrations or in temperatures above 60°C. It also excels at being resistant to working temperatures, at washing away effluents because of a smooth inner wall, a great stable shape and good insulation. It only absorbs minimum quantities of water (less than 0.02%) And only on the surface layer.

To the pure raw material we can, at our client's request, add additives to achieve the desired effect – for example halogens (bromides) are added for self-extinguishing, and better resistance to low temperatures can be achieved through co-polymerisation with other olefines (most frequently with ethylene).

There are various types of polypropylene with different molecular structure, for industrial purposes, however, only the isostatic polymer is relevant. It is used to produce pipes and fittings used in house sewage systems to drain away domestic and faecal sewage and rain water in buildings.

Advantages of Argo pipe system

- a wide-ranging selection of fittings in various diameters, lengths and shapes enable the fastest and the most economical installation
- simple installation – no expensive adhesives and kits necessary
- easy to repair and potentially replace
- the manner of connecting and a wide range of special fittings allow for an easy and fast connection of various pipes
- highly stable pipe shapes allow for an effective, functional, long-lasting and safe connection to a rubber gasket
- impact resistance
- excellent resistance to boiling water effluents from washing machines and dishwashers
- the surface structure allows for drainage of waste water without formation of crusts and sediments
- lower condensation due to a low thermal conductivity

Pipes, sockets, connectors, gaskets

Gaskets made of elastomer are already pre-installed in the suitable canal in the socket of the bottom part. They are made from materials that provide the best possible sealing, are the safest and have a lifetime equal to pipes and fittings. They comply with the conditions, methodology and frequency of control in accordance with standard EN 1451.

Argo can also provide you with numerous special elements needed for removing various installation problems: connectors made from various materials, special reducer elements including small sized reducer elements etc.

Be careful: Do not expose the gaskets to direct sunlight because they are not UV-stabilised.

Proper use of pipes and connecting elements

A professional installer of the fitting should plan and estimate every detail of the sewage system beforehand.

If a sewage system is to be installed outside the building, you should – before excavating – foresee a possibility of an unequal load on a part or parts of pipes due to possible eventual terrain subsidence. In these cases, we recommend that you excavate in a straight line with bends that enable the installation of special elements with specific angles (15°, 30°, 45° etc.). We also recommend that you line the bottom of the excavation with a smooth concrete base with a suitable incline and with suitable pipe holders to prevent pipe load only on the area of connectors.

Vertical fitting should pose no problem because the installation procedure is simplified by the connector sockets that function as dilation clips. Installations can be mounted in two ways:

- lay the pipe conduit so that the clips are cemented in the concrete slab of a storey:

- no additional securing is needed
- any pipe elongation under the concrete slab will be absorbed by the connector in the lower storey without any shear load in the dilution element.
- to compensate for the elongation it is essential to determine the eventual pipe dilation beforehand
- place a clamp in each storey to secure the pipes so that sliding is possible
- as a free pipe conduit, for example in the auxiliary shaft;

Ensure the primary ventilation by extending the drainage pipe through the ceiling of the top storey in the building. The diameter of the ventilation pipe above the last drainage point should be equal to the diameter of the drainage pipe (usually 110mm). Special muzzle protection above the ventilation pipe is not necessary, however, be sure to provide a protection that will prevent the snow covering the muzzle in wintertime.

As a rule this system is used for lower buildings. It could also be called installation with venting. In some cases it reduces or removes siphon effects due to vacuum, however it does not remove the siphon effects due to compression (pressure).

We also recommend that you follow the instructions below:

For pipe elongation, use a saw with fine teeth; saw so that the cut is at a right angle

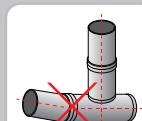

Brush the pipe ends with a special device or with a fine filer and deburr them at the angle of 15°; the surface of the brushed part must be smooth, because this is the only way to prevent damage to the peripheral gasket in the neck of the pipe into which you will be inserting the new pipe.

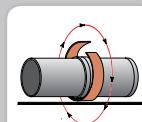

The ends of connecting elements should never be cut/shortened because the connector becomes unreliable.

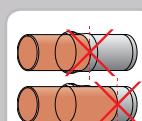

Always check the inside of the pipe socket, gasket and the new pipe end; intersperse the connectors with a material that allows sliding – soap water is also an option, but do not use mineral oil or grease.

Prevent excessive pipe movement as this can reduce the reliability of the pipe connector, and render the sealing incomplete.

We recommend that you cover the connectors so that the gaskets are protected from concrete which can damage them.

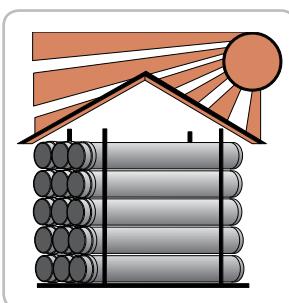

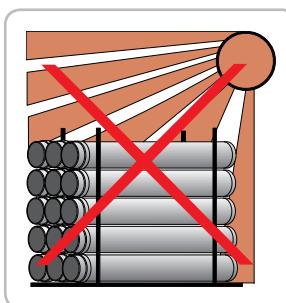

Insert the pipes in the socket – in the bottom part suitably deep; determine the depth in accordance with the necessary expansion joint; if the pipe is not inserted deep enough the sealing will not be complete; however, if it is inserted too deep you will prevent pipe elongation.

Transport and storing

Transport and store with care. Before transportation: pipes should be loaded horizontally and in a way that prevents crossing. The best option is to load the pipes onto palettes before transport. Insert the pipes into spacers in order to prevent them from damage.

The optimal storage facilities for pipes and fittings are closed or at least covered spaces that are protected against low temperatures, direct sunlight and other weather influences. This is especially important when temperatures drop below 0°C as, because of their structure, all polymers, even polypropylene, become brittle and less flexible. The best way to store pipes is to stack them horizontally on palettes. Do not stack them higher than 1.7m. The pipes should not be stored on the open and exposed to sun for more than 12 months.
